## Revision History

Date	Version	Notes
February 5, 2024	1.0	Initial Version
February 19, 2024	1.1	Updated with Feedback from Primary and Secondary Reviewers
February 19, 2024	1.2	Updated with better understanding of bias value
March 17, 2024	1.3	Updated with better understanding of Testing Instance Model
April 10, 2024	1.4	Updated Testing Instance Model and ensured tracibility to implementation
April 12, 2024	1.5	Updated according to Detailed Comments from Dr. Smith

# 1 Reference Material

This section records information for easy reference.

## 1.1 Table of Units

Throughout this document SI (Système International d'Unités) is employed as the unit system. In addition to the basic units, several derived units are used as described below. For each unit, the symbol is given followed by a description of the unit and the SI name.

symbol	unit	SI
px	pixel	picture element

## 1.2 Table of Symbols

The table that follows summarizes the symbols used in this document along with their units. The choice of symbols was made to be consistent with the heat transfer literature and with existing documentation for solar water heating systems. The symbols are listed in alphabetical order.

symbol	unit	description
$\mathbf{x}_{n \times m}$	Pixel	Matrix representing pixels of the input image with $n$ rows and $m$ columns,
$y$	Unitless	Number of type <b>R</b> representing the label of the input image (has typical values 0 or 1)
$\hat{y}$	Unitless	Number of type <b>R</b> representing the probability of the predicted label of the input image
$z$	Unitless	Scalar number of type <b>R</b> representing the combination of the input image and weights and biases, used to calculate the Predicted Label $\hat{y}$
$x_{i,j}$	Unitless	An entry in the input matrix $\mathbf{x}$ (at $i, j$ ) which represents the level of intensity of the pixel
$\mathbf{w}_{n \times m}$	Unitless	Matrix of weights that is used by the classifier model with $n$ rows and $m$ columns
$b$	Unitless	Bias value that is used by the classifier model
$\lambda$	Unitless	Regularization Parameter that affects flexibility/variance of the model
$\alpha$	Unitless	Learning rate of classifier model
$\sigma$	Unitless	Represents the Sigmoid Function

$L$	Unitless	Represents the Log Loss Function
-----	----------	----------------------------------

---

### 1.3 Abbreviations and Acronyms

symbol	description
2D	Two Dimensional
A	Assumption
DD	Data Definition
GD	General Definition
GS	Goal Statement
IM	Instance Model
LC	Likely Change
PS	Physical System Description
R	Requirement
SRS	Software Requirements Specification
TM	Theoretical Model
OAR	Optical Alphabet Recognition

### 1.4 Mathematical Notation

In this project documentation variables which represent matrices are indicated by bolded letters (ie.  $\mathbf{x}$ ), whereas all other variables are represented by regular printed letters.

## 2 Introduction

Images often contain important information to be used in many different modern applications. One such type of information that can be contained within images are readable characters. The motivation for the Optical Alphabet Recognition project is to create a system from scratch that can classify upper-case English letter characters accurately. More information about the problem itself can be found within the Problem Statement document ([Ceranica, 2024](#)). Furthermore, a foundational goal of this project is to be useful for educating people about the fundamentals of image classification.

The following section is an overview of the Software Requirement Specifications for the OAR project, specifically outlining the purpose of the document, the scope of the requirements, characteristics of the intended reader, and the organization of the document.

### 2.1 Purpose of Document

The purpose of this SRS document is to establish and clearly communicate the requirements, limitations, definitions, and models, in regards to the OAR project. This document will also serve as basis for reference for the rest of the documents supporting the project.

### 2.2 Scope of Requirements

The scope for this project is constrained to the recognition of images of singular, hand-written and printed, capital-letter English alphabet characters, in their standard written orientations. Character images can be black and white, grayscale or RGB images. However, this does not include hand-written cursive letters. Any pre-processing needed will be handled by supporting libraries, to perform the calculations described in this document. See the assumptions section, [4.2.1](#), for further details.

### 2.3 Characteristics of Intended Reader

Readers of this document are intended to have a basic level understanding of 2D image processing techniques (equivalent to a standard undergraduate course on machine learning). However, readers with a prerequisite of at least level one university mathematics knowledge (specifically including matrix linear algebra) will be able to understand and follow most of the concepts in the document, as the project is also intended to be a useful tools for learning about image processing.

### 2.4 Organization of Document

This SRS document contains an introduction to the problem being addressed by the software, and the overarching goals of the project. It is to be used as reference for readers based on the SRS template by [Smith and Lai \(2005\)](#); [Smith et al. \(2007\)](#). The scope, terminology, definitions and models used in the project are outlined, and more details about the specifics

of the problem and the explored solution are presented. Requirements, potential future changes and traceability information are also defined.

### 3 General System Description

This section provides general information about the system. It identifies the interfaces between the system and its environment, describes the user characteristics and lists the system constraints.

#### 3.1 System Context

Figure 1: System Context

- User Responsibilities:
  - Provide an image of a character to the program in the standard written orientation.
  - Be able to interact with the software program using a keyboard, computer mouse, and monitor.
  - Run the software on a system with the capabilities to sufficiently process computer graphics.
- OAR Responsibilities:
  - Provide the ability to load or change image files to be classified.

- Detect and warn about invalid or corrupt image files, upon input.
- Display the confidence in the result of classified characters.
- Provide a user interface that is able to take user input at anytime.

## 3.2 User Characteristics

The end user of the OAR software is anyone who can use character recognition software or wants to learn about it. This may include the intended readers of this document (as described in Section 2.3), however none of those reader requirements are necessary to use the software. The basic skillset needed to use this software is basic computer literacy and knowledge of the complete English alphabet.

## 3.3 System Constraints

The only real world design constraint for this project is that all input images must have the character in their proper legible orientation.

# 4 Specific System Description

This section first presents the problem description, which gives a high-level view of the problem to be solved. This is followed by the solution characteristics specification, which presents the assumptions, theories, definitions and finally the instance models.

## 4.1 Problem Description

OAR is intended to address the simple problem of converting data stored in images into usable string data through the use of optical character recognition. Specifically OAR focuses on classifying images of individual characters according to their corresponding English language alphabet characters. It should be able to do this and communicate to users the confidence level in how correctly it classified the image. Furthermore, this project is also intended to demystify the underlying theories behind optical character recognition for students and newer programmers, so it can be used as a learning tool.

### 4.1.1 Terminology and Definitions

This subsection provides a list of terms that are used in the subsequent sections and their meaning, with the purpose of reducing ambiguity and making it easier to correctly understand the requirements:

- **Classification:** A method of assigning pre-existing labels to processed images.
- **Confidence Level:** The probability that the label assigned to an image was correctly identified.

- Image: A representation of visual information that can be represented by a 2D matrix where each entry represents a pixel with an intensity value.
- Intensity: The value of a pixel representing its grayscale colour, on a scale from 0 (which represents black) to 255 (which represents white).
- Label: A value which associates the result of image classification with a real world category, such as English alphabet letters.
- Normalization: Altering the aspect ratio and scale of images to some arbitrarily set standard, [Karandish \(2022\)](#).

#### 4.1.2 Physical System Description

The physical system of OAR, as shown in Figure 2, includes the following elements:

PS1: The image that is being input.

Figure 2: A sample input image depicting the letter A

To maintain consistency within the software the images will be normalized to some set of  $n \times m$  pixels such that the trained model can classify any given input image. The physical representation of what this resizing will look like is seen in Figure 3.

Figure 3: A sample input image depicting the letter A, after being processed

#### 4.1.3 Goal Statements

Given an input image, the goal statements are:

GS1: Calculate and display the predicted corresponding character label (or the inability to calculate the label) for the unknown character in the image.

GS2: Calculate and display the confidence level that the predicted label is correct.

## 4.2 Solution Characteristics Specification

This section provides the assumptions, theoretical models, instance models, general definitions, and data constraints. The information in this section is intended to reduce ambiguity about the project and to present the problem in clear mathematical or logical terms.

The instance models that govern the OAR project are presented in Subsection 4.2.5. The information to understand the meaning of the instance models and their derivation is also presented, so that the instance models can be verified.

#### 4.2.1 Assumptions

This section simplifies the original problem and helps in developing the theoretical model by filling in the missing information for the physical system. The numbers given in the square brackets refer to the theoretical model [TM], general definition [GD], data definition [DD], instance model [IM], or likely change [LC], in which the respective assumption is used.

- A1: The image will already be normalized and pre-processed, as required by TM2, prior to any classification calculations.
- A2: The dataset used to train the software model as described by IM1, will only contain labels of capital letter characters.
- A3: The dataset used for training the software model as described by IM1, will contain a balanced distribution of every label that can be identified by the program.
- A4: All input images will display one single, properly oriented character, to be utilized by IM2.

#### 4.2.2 Theoretical Models

This section focuses on the general equations and laws that OAR is based on.

Number	TM1
Label	<b>Sigmoid Function</b>
Equation	$\sigma(z) = \frac{1}{1+e^{-z}}$
Description	The sigmoid function takes input $z$ of type <b>R</b> , and returns a value between 0 and 1. This function will be used to calculate the confidence level of the predicted value, to satisfy GS2.
Notes	None.
Source	<a href="#">Turin (2020)</a>
Ref. By	A1, GD1

Number	TM2
Label	<b>Log Loss Function</b>
Equation	$L(y, \hat{y}) = -\frac{1}{n} \cdot \sum_{i=1}^n (y_i \cdot \log(\hat{y}_i) + (1 - y_i) \cdot \log(1 - \hat{y}_i))$
Description	<p><math>y</math> of type <b>R</b> represents the actual label value (0or1)</p> <p><math>\hat{y}</math> of type <b>R</b> represents the predicted label value (<math>0 \leq \hat{y} \leq 1</math>)</p> <p><math>n</math> of type <b>R</b> is the total number of input values</p> <p><math>i</math> of type <b>R</b> is the current step in the summation</p> <p>This function utilizes the properties of the natural logarithm to determine how similar the actual value <math>y</math> is to the predicted value <math>\hat{y}</math>. The goal of the system is to minimize the Loss such that <math>\hat{y}</math> is as close in value to <math>y</math> as possible.</p> $L_{\hat{y}} = \begin{cases} -\log(\hat{y}) & , \text{ if } y = 1 \\ -\log(1 - \hat{y}) & , \text{ if } y = 0 \end{cases}$
Notes	None
Source	<a href="#">Turin (2020)</a>
Ref. By	A1, GD1, GD2, GD3, IM1

Number	TM3
Label	<b>Chain Rule</b>
Equation	$\frac{d}{dx} [f(u)] = \frac{d}{du} [f(u)] \frac{du}{dx}$
Description	This formula is used to derive the composition of two differentiable functions.
Source	<a href="#">Turin (2020)</a>
Ref. By	GD2, GD3

Number	TM4
Label	<b>Image Normalization</b>
Equation	$\mathbf{I}_N = (\mathbf{I} - Min) \cdot \frac{(newMax - newMin)}{(Max - Min)} + newMin$
Description	<p><math>\mathbf{I}</math> is an <math>n</math>-dimensional image matrix of type <math>\mathbf{R}</math>, with px intensity values in the range of <math>(Min, Max)</math></p> <p><math>\mathbf{I}_N</math> is the target new <math>n</math>-dimensional image matrix of type <math>\mathbf{R}</math>, with px intensity values in the range of <math>(newMin, newMax)</math></p> <p>This theory is used to ensure all image data is of the same form such that the classification model used can be properly applied to every input.</p>
Notes	None.
Source	<a href="#">Nor (2022)</a>
Ref. By	A1, R2, IM2

#### 4.2.3 General Definitions

This section collects the laws and equations that will be used in building the instance models.

Number	GD1
Label	<b>Sigmoid Function with Input Image and Weights</b>
SI Units	Unitless
Equation	$\hat{y} = \sigma(z) = \frac{1}{1+(e^{-z})}$ , where $z = \mathbf{w}^T \cdot \mathbf{x} + b$
Description	<p>This is a refinement of the Sigmoid function (see TM1) to represent how it will be utilized as the basis of the model.</p> <p><math>\mathbf{x}</math> is an input image matrix of type <math>\mathbf{R}</math>.</p> <p><math>\mathbf{w}</math> is a matrix of weights of type <math>\mathbf{R}</math></p> <p><math>b</math> is a bias value of type <math>\mathbf{R}</math></p> <p>The weights and biases are optimized in IM1 to better identify features of <math>\mathbf{x}</math> which correlate to label to be predicted.</p> <p>This is then converted into a value from <math>0 \leq \hat{y} \leq 1</math> by the sigmoid function.</p>
Source	<a href="#">Turin (2020)</a>
Ref. By	GD2, GD3, IM1, IM2

Number	GD2
Label	<b>Gradient of Log Loss Function with respect to <math>\mathbf{w}</math></b>
SI Units	Unitless
Equation	$\nabla_{\mathbf{w}}(y_i \cdot \log(\hat{y}_i) + (1 - y_i) \cdot \log(1 - \hat{y}_i)) = \mathbf{x}_n \cdot (y_n - \hat{y}_n)$
Description	<p>Here we derive the Log Loss Function with respect to <math>\mathbf{w}</math> using chain rule from TM3, with <math>\hat{y}</math> defined using the Sigmoid Function (see GD1), so that we can minimize the Log Loss Function to train the model (see IM1).</p>
Source	<a href="#">Turin (2020)</a> ; <a href="#">Sharma (2022a)</a>
Ref. By	IM1

Number	GD3
Label	<b>Gradient of Log Loss Function with respect to <math>b</math></b>
SI Units	Unitless
Equation	$\nabla_b(y_i \cdot \log(\hat{y}_i) + (1 - y_i) \cdot \log(1 - \hat{y}_i)) = y_n - \hat{y}_n$
Description	Here we derive the Log Loss Function with respect to $b$ using chain rule from TM3, with $\hat{y}$ defined using the Sigmoid Function (see GD1), so that we can minimize the Log Loss Function to train the model (see IM1).
Source	<a href="#">Turin (2020)</a> ; <a href="#">Sharma (2022a)</a>
Ref. By	IM1

### Detailed Derivation of Gradients

There are three steps to derive the Gradients of the Log Loss Function, using TM3. First the outer-most derivative:

$$[-y \cdot \log(\hat{y})]' = \frac{-y}{\hat{y}},$$

and,

$$[-(1 - y) \cdot \log(1 - \hat{y})]' = \frac{(1 - y)}{(1 - \hat{y})},$$

which combines to,

$$\frac{-y}{\hat{y}} + \frac{(1 - y)}{(1 - \hat{y})} = \frac{(\hat{y} - y)}{(\hat{y} \cdot (1 - \hat{y}))}$$

Then we take the derivative of  $\hat{y} = \sigma(z)$  using the following identities:

$$\begin{aligned} 1. & 1 - \sigma(z) = 1 - \frac{e^z}{(1+e^z)} = \frac{1}{(1+e^z)} = \sigma(-z) \\ 2. & \frac{d}{dz} \cdot \sigma(z) = \frac{d}{dz} \cdot (1 + e^z)^{-1} = \frac{e^{-z}}{(1+e^{-z})^2} = \frac{e^{-z}}{(1+e^{-z})} \cdot \frac{1}{(1+e^{-z})} = \sigma(-z) \cdot \sigma(z) = (1 - \sigma(z)) \cdot \sigma(z) \end{aligned}$$

Which gives  $y'_n = y_n \cdot (1 - y_n)$

Then finally we take the last derivative in the chain, which is where the gradient derivations differentiate:

$$\begin{aligned} \text{For GD2: } \frac{d}{d\mathbf{w}} \cdot (b + \mathbf{x}_1 \cdot \mathbf{w}_1 + \dots + \mathbf{x}_n \cdot \mathbf{w}_n) &= \mathbf{x}_i \\ \text{For GD3: } \frac{d}{db} \cdot (b + \mathbf{x}_1 \cdot \mathbf{w}_1 + \dots + \mathbf{x}_n \cdot \mathbf{w}_n) &= 1 \end{aligned}$$

Then each derivative in the chain is multiplied together for  $\nabla_{\mathbf{w}}$  and  $\nabla_b$  respectively, resulting in the final formulas seen in GD2 and GD3. These derivations are referenced from [Sharma \(2022a\)](#).

#### 4.2.4 Data Definitions

This section collects and defines all the data needed to build the instance models. The dimension of each quantity is also given.

Number	DD1
Label	<b>Learning Rate</b>
Symbol	$\alpha$
SI Units	Unitless
Equation	Not Applicable
Description	Learning Rate is the value that is used to help the model minimize the Log Loss function effectively at each step. While there is no concrete equation to determine the learning rate it is suggested that fine-tuning is done by increasing or decreasing the value by a factor of 10.
Sources	<a href="#">Sharma (2022b)</a>
Ref. By	IM1

Number	DD2
Label	<b>Regularization Parameter</b>
Symbol	$\lambda$
SI Units	Unitless
Equation	Not Applicable
Description	The regularization parameter is a value that is used to help the model minimize the Log Loss function to reduce overfitting. While there is no concrete equation to determine the regularization parameter it is suggested that fine-tuning is done by increasing or decreasing the value by a factor of 10.
Sources	<a href="#">Sharma (2022b)</a>
Ref. By	IM1

#### 4.2.5 Instance Models

This section transforms the problem defined in Section 4.1 into one which is expressed in mathematical terms. It uses concrete symbols defined in Section 4.2.4 to replace the abstract symbols in the models identified in Sections 4.2.2 and 4.2.3.

The goals GS1 and GS2 are solved by IM2. IM1 is used to train the model so that IM2 can be used reliably and efficiently.

Number	IM1
Label	<b>Model Training via Gradient Descent</b>
Input	$\mathbf{x}_n, y_n, \hat{y}_n = \frac{1}{1+(e^{(\mathbf{w}^T \cdot \mathbf{x} + b)})}, \alpha$ from DD1, $\lambda$ from DD2, $N$ which is total the number of training images  The input is constrained so that A2 and A3 can be satisfied.
Output	$\mathbf{w}, b, L$
Description	<p>Using gradient descent we minimize the Log Loss Function to optimize the weights and biases for better predictions</p> <p>This is executed as a multi-step summation in the following order, for each image in the training set <math>\mathbf{x}_n</math> over multiple epochs, where <math>t</math> represents one step in the summation to further optimize the values:</p> <ul style="list-style-type: none"> <li>• 1. For each set of training images, calculate the following: <ul style="list-style-type: none"> <li>– 1.1. <math>d\mathbf{w}^{(t)} = \mathbf{x}_n \cdot (y_n - \hat{y}_n) - \frac{\lambda}{N} \cdot \mathbf{w}^{(t)^2}</math></li> <li>– 1.2. <math>db^{(t)} = y_n - \hat{y}_n</math></li> <li>– 1.3. <math>\mathbf{w}^{(t+1)} = \mathbf{w}^{(t)} + \alpha \cdot d\mathbf{w}^{(t)}</math></li> <li>– 1.4. <math>b^{(t+1)} = b^{(t)} + \alpha \cdot db^{(t)}</math></li> </ul> </li> <li>• 2. Calculate the Log Loss <math>L</math> to ensure it is being minimized and test the results using the updated weights.</li> </ul>
Sources	Turin (2020); Sharma (2022a)
Ref. By	A2, A3, IM2, R3

Number	IM2
Label	<b>Label Classification</b>
Input	$\mathbf{x}, \mathbf{w}, b$ The input is constrained such that $\mathbf{x}$ is normalized by TM4 so that A1 can be satisfied.
Output	$\hat{y}$
Description	Using the equation: $\hat{y} = \sigma(z) = \frac{1}{1+(e^{-z})}$ , where $z = \mathbf{w}^T \cdot \mathbf{x} + b$ , see GD1 Where $\mathbf{w}$ and $b$ are the optimized weights and biases from IM1, $\mathbf{x}$ is the normalized input, and $\hat{y}$ of type $\mathbf{R}$ is the prediction $\hat{y}$ is the output of the Sigmoid function, calculated for each of the 26 labels, and can be compared to determine the most likely label as the $\hat{y}$ value that is closest to 1. In addition the confidence level in the prediction is represented by the numerical value of $\hat{y}$ for the best predicted label.
Sources	Turin (2020); Sharma (2022a)
Ref. By	R4, R5, GD1

#### 4.2.6 Input Data Constraints

Table 1 shows the data constraints on the input output variables. The column for physical constraints gives the physical limitations on the range of values that can be taken by the variable. The column for software constraints restricts the range of inputs to reasonable values. The software constraints will be helpful in the design stage for picking suitable algorithms. The constraints are conservative, to give the user of the model the flexibility to experiment with unusual situations. The column of typical values is intended to provide a feel for a common scenario. The uncertainty column provides an estimate of the confidence with which the physical quantities can be measured. This information would be part of the input if one were performing an uncertainty quantification exercise.

The specification parameters in Table 1 are listed in Table 2.

<sup>1</sup> The constraints on the input image matrix are strictly on it's size  $n \times m$  not on the matrix itself.

#### 4.2.7 Properties of a Correct Solution

A correct solution must come in the form of one of the 26 possible labels,  $\{A, B, C, D, E, F, G, H, I, J, K, L, M, N, O, P, Q, R, S, T, U, V, W, X, Y, Z\}$ , as well as

Table 1: Input Variables

Var	Physical Constraints	Software Constraints	Typical Value	Uncertainty
$x_{i,j}$	-	$\min x_{i,j} \leq x_{i,j} \leq \max x_{i,j}$	128	-
$\mathbf{x}_{n \times m}^1$	-	$\min n, m \leq n, m \leq \max n, m$	$1024 \times 1024$	-

Table 2: Specification Parameter Values

Var	Value
$\min x_{i,j}$	0
$\max x_{i,j}$	255
$\min n \times m$	20 px $\times$ 20px
$\max n \times m$	4096 px $\times$ 4096px

an associated confidence level, as a percentage, that the label assigned is correct.

## 5 Requirements

This section provides the functional requirements, the business tasks that the software is expected to complete, and the nonfunctional requirements, the qualities that the software is expected to exhibit.

### 5.1 Functional Requirements

R1: Accept an input image in the following formats:

- PNG (Portable Net Graphics)
- JPEG (Joint Photographic Experts Group)
- BMP (Bitmap)

R2: The input image shall be pre-processed to normalize data to be used in calculations (see TM4).

R3: OAR shall provide a trained model that can accurately classify images using 26 different labels (see IM1).

R4: Calculate and display the classified label for the input image (see IM2).

R5: Calculate and display the confidence level that the assigned label is correct (see IM2).

## 5.2 Nonfunctional Requirements

- NFR1: **Accuracy** The accuracy of the computed label confidence should be consistent enough that the results could be considered comparable to other logistic regression solutions for this problem. As such, the accuracy of the model on the training data set should be output in the form of a confusion matrix. In addition the confidence level output has to be calculated in a similar way to existing solutions so that the output can be verified and compared to other algorithms.
- NFR2: **Usability** The user should be able to intuitively use the software and understand the output that is displayed. To accomplish this the software should be user-friendly, simple, and require little setup. A user survey may be conducted to verify the software's perceived usability.
- NFR3: **Maintainability** The code should be clear and understandable to make further development by other programmers possible with little hassle, as well as to help educate newer programmers as to how image classification works. Adding further features, or understanding how the software presently works should not be a difficult task.
- NFR4: **Portability** The software should be cross-platform (Windows, Linux, MacOS) with little to no setup required. This can be in the form of an executable python-based application.

## 5.3 Rationale

The rationale for A1 to limit the scope of the project to the problem of classification, rather than including other problems such as normalization, given that GS1 and GS2 are the goals of the software which return an output to the user.

## 6 Likely Changes

The changes listed below are likely to be implemented as the software is developed further.

- LC1: Expand the number of classification labels to include lower-case English letter alphabet, numerical, and punctuation characters.
- LC2: Allow the user to specify whether the image is being input from a camera or from a pre-existing file on their system.

## 7 Unlikely Changes

LC3: Expand the functionality of the program to classify whole English words and sentences instead of just individual characters.

LC4: Provide the choice of different image classification algorithms.

## 8 Traceability Matrices and Graphs

The purpose of the traceability matrices is to provide easy references on what has to be additionally modified if a certain component is changed. Every time a component is changed, the items in the column of that component that are marked with an “X” may have to be modified as well. Table 4 shows the dependencies of theoretical models, general definitions, data definitions, and instance models with each other. Table 5 shows the dependencies of instance models, requirements, and data constraints on each other. Table 3 shows the dependencies of theoretical models, general definitions, data definitions, instance models, and likely changes on the assumptions.

R4		X									
R5		X									
NFR1		X									
NFR2		X	X								
NFR3											
NFR4											

Table 5: Traceability Matrix Showing the Connections Between Requirements and Instance Models

## 9 Values of Auxiliary Constants

There are no auxiliary constants defined so this section is not applicable for this project.
